

MAINS MASTER PROGRAM (MMP) 2024
INDIAN SOCIETY – 2
POPULATION AND ASSOCIATED ISSUES:

World Population distribution:

1. Greater than 8 billion plus population
2. Population distribution is not uniform there are reason and spatial variation
3. Physical factors like extreme climate, unfavorable conditions like water scarcity then the population very sparse
4. Areas that have favourable condition like large rivers, good soil warm and long growing seasons have greater population concentration
5. Some of the largest population regions of the world are in Asia and Africa. The population concentration in this region is due to long history and history of continuous living.
6. ASIA account for greater than 60% of world population.
7. Africa account for 15 to 17% of all population.
8. Europe accounts for 10 to 12% of world population.
9. Asia and Africa have long history of population and settlement. India and China has greater than 35% of world population. This is because of the favourable climatic conditions, large rivers and long history of civilization.

Though natural factors play an important in the distribution of population. However it is human factors that play more important role like **development, history, government policies** etc. For example: Development of Las Vegas inside desert, Development of Switzerland in Mountainous area.

Human factors like **trade and migration** place a very important role in the distribution of population. Example distribution of African origin population to South America Central America and Southern USA.

Government policies also affect settlement and development of cities like Brazilia, Islamabad. So, Growth of areas cannot be explained in terms of environmental factors alone. For Eg: Urban areas offer employment better quality of life, good standard of living, opportunities of growth.

Population Growth: It refers to the measure of how population of a region adds up and expands. It is very important to study and its effect on the aspects of life and living because population growth reflects **history, development, resource use and conflicts**.

Theories of Population Growth:

1. **Malthus Theory:** Man ability to increase its population is much more than the ability of land and agriculture to provide for food. The population growth can increase in Geometric Progression whereas the food can increase in Arithmetical Progression. The population can multiply very fast but the land cannot increase their food beyond a limit. So, the population growth is limited by food availability. Eventually when there is high population growth there are issues like epidemics, hunger, starvation, famine. These factors which will increase mortality rate and population will decelerate eventually. These factors were referred by Malthus as Positive check. This idea is carried forward by **Neo Malthusian** which which mention that there is limits to growth. The theory has limitations. Malthus did not taken to account technology like Green Revolution and methods to control population. Moreover hunger, poverty, famine are not the consequences of population growth. These are consequences of unequal policies historical reasons and conflicts related to war. Positive checks mentioned by malthus operates in very traditional primitive society and not in today's world.
2. **Marxian Interpretation:** Karl Marx blames capitalist form of society for the reason of population growth. There are two evils in the capitalist form of society: Class divide and private property. Inequalities and exploitation in the capitalist form of society forces the poor to increase their numbers. Capitalism is governed by profit motive and therefore there are low wages and low income given to the labourers. According to Karl Marx, growth of population is a compulsion for labour who needs more hands to work to compensate for declining wages and labour exploitation.
3. **Demographic transition Theory:** It mentions how the population growth change with the changing nature of society and development. Population growth is related to economic development. It was seen that a society goes through three phases:
 - **Phase 1: High birth rate and High Death Rate.** It can be seen in tribal societies like Sentinelese, Andamanese, Pygmies. Malthus Theory Operates here.
 - **Phase 2:** Decline in mortality rate due to increase in Standard of living, food availability, better health conditions so the phase of **High Birth Rate and Declining Death Rate.** Decline in the fertility rate is slower as compared to death rate. Falling death rate can be due to better medical facilities, control of epidemics and famine. Falling birth rate can be due to increasing urbanization and cost of living, better education facilities, empowerment of women.
 - **Phase 3: Low birth rate and low death rate** with stabilized population growth rate

India presently is at the stage where the death rate has fallen and the population birth rate is has started to fall down

The stages can also be shown via Age Sex Pyramid

Relation between population and poverty

1. There is a strong correlation between high population growth and poverty. The relationship is however not as Marx and Malthus predicted.
2. The growth in the population is related to poverty more in the terms of **lack of education, Traditional societies, lack of awareness on contraceptive, Type of economy (agriculture V/s Service Sector), Rural V/s Urban areas, improper healthcare** that increases the mortality rate of the infant (IMR) and the mother (MMR) so the parents are insecure and give birth to more child, lack of reproductive rights of women in traditional and rural society
3. The modern theories of population therefore discuss the critical role of women in population control. This has been given emphasis by J S Mill and Arsene Dumonte.
4. Role of Women in controlling the growth rate was also mentioned in the first global conference on population in 1994 (International Conference on Population and Development) who mentioned the role of reproductive rights to be exercised by women and empowerment of women in controlling the population growth.

Role of women in controlling the population growth

- Age of Marriage
- Education
- Economic Empowerment
- Exercising Reproductive Rights
- Health Parameter
- Use of contraceptives
- Lifestyle Changes: For example: Increase in the sedentary lifestyle has lead to increase in the chronic diseases and lifestyle diseases

Demographic Parameters:

Death Rate:

Factors affecting Death Rate are:

- Medical facilities: Accessibility and affordability of the medical facilities.
- Nutrition: affordability and awareness of the nutrition needed
- Wars
- Pandemics

Age Structure and Aeging of World Population

	0-14	14-65 (developed) /60 (developing)	65+/ 60+
World	25	65	10

Developed World	15	65	20
Less Developed World	40	53	7
China	17	71	11
India	27	67	6

Observation:

1. World population is expected to **age among all the group**.
2. **Proportion of age group of 65+ will see maximum increase. Reason: Consistent decline in the fertility and mortality rates.** Therefore the **future policy should** take into account **the healthcare needs, geriatric care and also increase the Social Security expenditure.**
3. World Policies should be such that to **tap the experience and the skill of the elderly** and make use of **it skill and train the younger population.**
4. **World Bank** has mentioned this as they need to tap the **Second Demographic Dividend for the benefits of economy.** Such efforts have also been utilised by the **Government of India** via the scheme of **ANUBHAV** where in the experience and skills of the elderly of the senior citizen is used in **skilling the youthful population.**

Case Study: China will see greater effect of ageing population due to drawback of the **ONE CHILD POLICY OF CHINA**

	0-14	14-65 (developed) /60 (developing)	65+/ 60+
World	25	65	10
China	17	71	11

Issues due to ageing of population:

- Shortage of the workers and therefore increasing cost of Industries. Examples shifting of textile industries and the other industries from China to the South East Asia.
- Shortage of the military personnel
- 1-2-4: One child, 2 parents and 4 grandparents effect and therefore increasing Social Security expenditure
- Diminishing market as it is the younger population that consumes more as compared to that of the elderly population
- Increasing dependency ratio

Sex Ratio:

Definition:

- India: Number of females per 1000 males.
- World: Number of males per 100 female.

Definition of Child Sex Ratio/ Sex Ratio at Birth:

- Number of females per 1000 males in the age group of 0-6 years.

Both the ratio are important parameter to find the gender equity in a population, know the preference towards the boy child and know about women empowerment.

Temporal Trend of Sec Ratio in India:

The number of females per 1,000 males has increased from 944 in 2011 to 1,020 in 2019-21 and sex ratio at birth has also improved from 919 in 2011 to 929 in 2019-21

Year	1991	2001	2011	NFHS-5
Sex Ratio	927	933	944	1020
Child Sex Ratio	940	927	914	929

Sex Ratio and Child Sex Ratio/ Sex ratio at Birth has improved since 2011. High female literacy had a favourable influence on sex ratios

Spatial Trend:

#) Sex Ratio: (Avg: 1020/1000 male)

N-S divide in Sex Ratio:

- **S: Kerala** had highest sex ratio among the states: 1,121, Lakshadweep: 1187
- **N:** Sex Ratio below the national is in **Bihar, Himachal Pradesh, Meghalaya, Nagaland.**

#) Child Sex Ratio/ Sex ratio at Birth: (929/1000 male).

Sex-Ratio at birth which is 929 is still below the mark of 952 that WHO estimates as the natural sex ratio at birth indicating continued sex selection at birth, preference for male child, female foeticide

N-S divide in Child Sex Ratio:

- **S state:** Kerala, Karnataka, Andhra Pradesh, Puducherry, Lakshadweep (**exception: T.N, Telangana**) have sex ratio at birth Higher than national Average
- **N state:** Himachal Pradesh, Punjab, Haryana, Chandigarh, Raj, Delhi, Maharashta, Jharkhand, Odisha have sex ratio at birth lower than national Average

Observation about child sex ratio at birth:

1. In backward states and districts, female-male ratio is better as medical facilities are yet to become easily available. In districts where these are available, sex determination goes up and sex ratio declines
2. Urban sex ratio for children is lower than rural for due to greater access to the sex selection technologies
3. Sex ratio at birth in Kerala saw the sharpest fall among major states in the last five years as per NFHS 5

4. The practice of sex selection at birth has spread to even traditional states of Jharkhand and southern states like Tamil Nadu
5. Some of the worst sex ratio at birth states such as Haryana, Punjab and Delhi have shown significant improvement but still need to work more to come at par with National average

Observation about sex ratio at birth:

1. Overall Urban sex ratio is low also because of male selective migration from rural to urban areas
2. Increase in overall sex ratio the combination of increased sex ratio at childbirth and increased life expectancy of female

Literacy Rate**Recent developments:**

1. Overall Literacy rate: 77%. As per UNESCO, India will achieve Universal Literacy in the year 2060.

Male V/s Female:

1. Male Literacy in 2021: 84% and Female Literacy: 70%

Rural V/s Urban:

- Literacy rate is 87.7% in urban places and 73.5% in rural.

Literacy Rate in various state:

- **States with literacy rate above national average:** Kerala, Northern states: Delhi, H.P, Uttarakhand, Punjab, Haryana and others: Gujarat, Maharashtra, West Bengal, Assam.
- **States with literacy rate above below average:** Northern State: Bihar, Rajasthan, UP and Southern State: Andhra Pradesh, Telangana
- Highest Literacy: Kerala 96%
- Lowest Literacy Rate: Andhra Pradesh: 63%

Bihar: (70%: Literacy Rate) Hence, there is a significant increase in the literacy rate of Bihar. Many programs were launched by the government to boost literacy rates.

Question: Literacy and delivery of service, not religion influences fertility. Comment.

Urbanization:**Concept:**

Movement of people from rural to urban areas:

- Change in residence.
- Change in occupation.
- Change in values/attitude/beliefs, etc.

Urban areas are very important for the prosperity of the world. According to World Bank, every country is experiencing urban population growth and the growth in the urban areas. Sustainable organization is important to achieve many SDG1, 2 and SDG 11.

The ideology of Urbanism:

- Way of life.
- Organization of society on the basis of:
 - Complex division of labor.
 - High level of technology.
 - High social mobility.
 - Economic interdependence.
 - Impersonality in social relations.

Data:

- According to NITI Aayog, cities in India occupy only 3% of the land, but they contribute 60% of the GDP.
- India is the world's second largest urban system, with almost 11% of the total global urban population residing in Indian cities.
- Within the next two decades, India's urban population is predicted to exceed 50% of the total population.
- By 2036, urban growth is predicted to account for 73% of overall population growth.

World Urbanization Prospect Report, 2018:

- India, China, and Nigeria will constitute major urbanization population growth between **2018-2050**.
- According to the **Confederation Realstate Development Association of India**, the urban population contributes **63%** of India's GDP.
- **Urban poverty** is increasing, according to the World Bank by **2035**, **most** of the extremely poor will be found in urban areas.

Importance of urban areas:

1. They are centres of innovation and centres of growth.
2. They are generally associated with improved quality of life and social well being and high standard of living.
3. They are the centres of modern values and modern civilization
4. They absorb migrants.

Characteristics of urbanisation in Indian Cities:

- Indian towns are growing more on the basis of tertiary rather than the secondary sector. It is very ironic that cities in India have developed as a result of the growth of

the tertiary sector. The growth in the communication sector, transport, services and construction were the main factors for the growth of Indian cities

- But in developed countries it is the manufacturing sector which led to the growth of cities.
- Southern India is more urbanized than that of Northern and Eastern India. This is because of the historical, socio-cultural and educational resource factors widely available
- With the introduction of globalization in India, the development of South India was very high due to high FDI and establishment of various kinds of industries in these states.

Problems associated with urbanization:

Urbanisation is generally associated with better facilities like education, sanitation, housing, health care, better job opportunities and social changes. However due to lack of planning, problems associated are:

What is an urban area?

- Whether it refers to city, metropolitan area, city region, peri urban areas is a matter of debate.
- According to census urban area refers to an area which has at least 5000 independent has density of 400 people per square kilometre and at least 75% of the male population is engaged in the non farm activities. As per census, 30% of population is in urban areas. If we relax and keep it to only 5000 people then it will become 47% population.
- As per satellite data (looks up for build up areas), 63% of population is in urban areas.
- World Bank has classified India's urbanization as malfunctioning, messy and hidden. World Bank uses agglomeration index that is also includes the periphery areas it is a globally used measure and as per it 55% of India lives in the urban areas therefore we say that are urbanization is hidden.

The second major issue is the rate **and the pace of urbanization is far more than what the resources can support** and it is at faster rate than what the government can plan for.

Here, resources not only means the natural resources but also about the amenities like buildings houses roads etc. Because of the lack of planning what we have today is a dysfunctional urbanization with **problems of housing, sanitation, security, problem of urban sprawl and health issues** and therefore we need balanced urban planning and sustainable urban planning

Urban sprawl:

- A dispersed outgrowth of areas outside the city's core engulfing villages.
- It is characterized by low-density residential housing.

- There is an increased reliance on private vehicles.
- The cause of sprawl was to accommodate the rising population and the desire for increased living space another immunity.

Implications of urban sprawl:

- Pollution
- Traffic congestion
- A decline in community cohesiveness.
- The decline in community cohesiveness
- Environmental degradation

Slums:

- Slums are urban dwellings that are unfit for human habitation, as it is dilapidated, poorly ventilated, and unclean. For example WASH (Drinking water, Sanitation, Hygiene)
- World Bank states that 35.2% of the urban population lives in slums.
- In India about greater than 50% of the urban population lives in these slums or in unauthorised areas
- A general perception was that slums were proliferating due to migration. However, according to an expert group on urban poverty and slums, it results from the failure of housing policies.
- Slums account for 1/4 of all urban housing. In Mumbai, more than half the population lives in slums, which are often situated near employment centers in the heart of town

Slums are persisting due to:

- They are the most politically active section of society.
- Hence constitute a major vote bank.
- It contributes to the labor force as the majority of the informal economy is thriving in slums.
- Sub-culture of poverty: There exists a subculture of poverty, hence, a feeling of relative deprivation does not develop.
- Although slums were perceived to be a temporary problem, however, it has now become a permanent structural problem.

Problems with respect to housing:

- Improper city planning due to heritage of past constructions.
- Lack of private developers.
- Lack of integrated planning. The entire focus is on land use, without taking into consideration, environmental aspects, transportation, and socio-economic needs.
- Failure to implement the National Urban Housing and Habitat Policy, according to which 15% of the land is to be allocated every year for social housing.

- The problem of gated communities: It will lead to unaffordable housing.
- Corruption, laxity on part of the administration, political will, etc.

Issues in Physical infrastructure:

- The problem of waste generation and waste management.
- Rapid urbanization has caused environmental degradation as congestion of people in limited space reduces the quality of air and contaminates water.
- According to World Air Quality Report by IQ Air, 10 out of 15 polluted cities are in India.
- According to WWF, by 2050, at least 30 Indian cities will face major water risks.
- The problems range from poor management of water resources, leaky distribution networks, and the vast volume of untreated wastewater being dumped in Indian rivers.
- Transportation: Inadequate road infrastructure and inefficient public transportation systems lead to capacity overloading and problems like road accidents, traffic jams, etc.

Socio-cultural problems:

- Residential segregation based on primordial identities (caste, class, religion, ethnicity) leads to a spatial pattern of communal violence.
- Relative deprivation due to unequal access to resources leads to crime.
- Degradation of value system: aggravated the abuse against marginalized sections.
- The proliferation of slums:
- Isolated areas: High probability of pathological behaviour.
- The disintegration of joint families:
 - Lack of primary socialization.
 - Lack of social control.
 - Increase in juvenile delinquency.
- Social stratification.
- The vicious cycle of poverty.
- Lack of trust between migrants and natives.
- Marginal man.
- Loss of human capital.

Water scarcity problems.

- Almost all the megacities of India face extreme water stress in Agra Jaipur Ahmedabad.
- **Case study: Shimla drying up of the perennial,** Giri River affected the water distribution system. Increasing tourists influx and with increasing heat waves, dry spell, climate change.

Problems related to waste management:

- In the world more than 2 billion of the waste is generated every year by 2050 it will become 3.5 billion turn waste
- in India nearly 60 million tonnes per year of waste is generated but waste collected is only 40 million tonnes while they treated waste is about 12 million tonne so nearly 28 million tons goes to the landfill
- Example ghazipur landfill in Delhi is asia's largest garbage mountain. landslide has also worked here this and there has been issues of the waste disposal.
- The waste disposal also forces hazardous issues like fires increasing the pollutants, pollution of the water because of the seepage of the West and it has also seen that there has been fires in Bangalore lakes too because of the waste, Yamuna River Foaming.

Problem related to pollution:

- According to UN report about 70% of the greenhouse gases emission is from the urban areas.
- World air quality report says that 22 out of 30 most polluted cities are in India Delhi, Mumbai, Kolkata, Surat, Kanpur, Ghaziabad, Noida and Gurgaon

Problems related to climate change:

- Flash floods
- Coastal submergence for Mumbai Chennai, Bangkok, Miami, Perth etc. one metre rise in New York of the sea level can inundate most part of the coastal areas subways sanitation facilities and power plants
- Heat waves
- Epidemics
- Droughts
- Water shortages

According to UN habitat report, more than 200 million Africans could be displaced by the effects of climate change by 2050 due to increasing heat waves global warming desertification etc

Concept of Urban Heat Island**Way forward:**

- Tackling rural-urban migration..(PURA, Satellite Towns: NCR Planning, Developing Counter Magnets)
- Developing social security net for slum dwellers.
- Sustainable urban development
- Employment generation and skill development of migrants.
- Capacity building in urban local bodies.

- Provide affordable housing.
- **Creation of inclusive cities:** The poor and low-income groups should be mainstreamed. The planning should include the needs of the marginalized.
- Several sources of funding need to be tapped for example PPP, issuing of municipal bonds monetization of land assets.
- **Cascaded planning structure:** One needs to have plans for a long-term vision along with immediate targets.
- **With respect to local capacity building:** New cadre for city administrators, Development of professional managers, Development of expertise, Encourage rental housing.
- New models of development need to be explored: Transport-oriented development, Develop a multimodal transport system

New Models and Good Practices: NEOM-THE LINE, SPONGE CITY, Solid Waste Management in Okhala, Delhi Metro.

Solid Waste Management in Okhala:

- Timarpur Okhla Municipal Solid Waste Management project is the first commercial waste-to-energy facility in India that aims to convert one-third of the Delhi garbage into the much-needed electricity, enough to serve 6 lakh homes.
- It has become the first to get carbon credits from the United Nations Framework Convention on Climate Change (UNFCCC) in the country in 2013

Administrative Reforms Commission (ARC) in its 6th report mentioned measures to strengthen the urban governance:

- Urban local bodies should be given responsibility for water supply and distribution in their territorial jurisdiction whether based on their own source or collaborative arrangements with other service providers
- Sanitation as a matter of hygiene and public health, must be given priority and emphasis in all urban areas. In all towns, advance action for laying down adequate infrastructure should be taken to avoid insufficiency of services
- Community Participation and co-production of services should be encouraged by municipal bodies. This should be supplemented by awareness generation.
- In all towns and cities with a population above one lakh, the possibility of taking up PPP projects for collection and disposal of garbage may be explored
- Municipal bodies should be encouraged to take responsibility of power distribution in their area
- Urban Transport Authorities, to be called Unified Metropolitan Transport Authorities in the Metropolitan Corporations, should be set up in cities with population over one million within one year, for coordinated planning and implementation of urban transport solutions with an overriding priority to public transport.

Efforts Taken by Government:

Smart City Mission:

- The Smart Cities Mission aimed at promoting cities that provide core infrastructure and give a decent quality of life to its citizens, a clean and sustainable environment, and the application of 'Smart' Solutions.
- This includes assured water and electricity supplies, efficient sanitation, solid waste management, and public transport, adequate healthcare and education facilities, and affordable housing, especially for economically-weak sections of society.
- Beyond these basic requirements, such cities must also offer robust information technology connectivity, which will allow for citizen participation in community matters and improved local governance.

Importance of Smart Cities Mission:

- With 70% of India's built environment for 2030 yet to take shape, its impending urban transformation also represents significant opportunities for domestic and international investments.
- The Mission will cover 100 cities and its duration will be five years from 2015 to 2020. The Mission is implemented by the Ministry of Urban Development (MoUD).
- SCM will be operated as a Centrally Sponsored Scheme (CSS) where the central Government proposes to provide financial support up to 100 crore per city per year. An equal amount, on a matching basis, will have to be contributed by the State/ULB.
- To achieve sustainable growth, the cities will have to become more liveable and safer with clean air, adequate infrastructure, reliable utilities, and opportunities for learning and employment.
- All 100 Smart Cities have established their SPVs, constituted their City Level Advisory Forum (CLAF), and all cities have appointed PMCs, indicating that all these Smart Cities are in Mission mode.
- Integrated Command and Control Centres (ICCCs) becoming operational in 15 cities has resulted in enhanced efficiency in governance, management of traffic, law enforcement, improved citizen grievance redressal, and reduced criminal incidents on city streets and public spaces.
- Smart Cities and AMRUT programs have opened up avenues for local industry and global players to participate in the development of cities across such sectors as utilities, housing, mobility, telecommunications, information technology, healthcare, education, and recreational facilities.
- Smart cities mission is also playing a vital role in creating new opportunities for better management of waste: For example, Agra – which houses the Taj Mahal plans to install 2,93,000 garbage containers tagged with radio frequency identification (RFID). These waste containers will be tracked throughout the city to ensure they are used to their maximum efficiency.

Questions:

Q) While on one hand urbanization is creating the potential for social integration and economic development, on the other hand, it is leading to socio-economic exclusion. Explain the paradox. (150 words/ 10 marks)

Q) Stating the problems arising due to haphazard urbanization in India, mention the steps taken by the government to address them. (150 words/10 marks)

Q) The surge in urban crimes is a grim reminder of rapid urbanization in India. Discuss. Also, suggest a few steps to tackle the issue of urban crimes.

Q) Discuss the various social problems which originated out of the speedy process of urbanization in India. (150 words/10 marks)

Women Issues:

1. **Concept of gender**
2. **Patriarchy: Concept , manifestation, structure: family, education, media, symbolism, caste, religion**
3. **Patriarchy vis-à-vis work: Statistics, sectors (Agri, industries, service, informal), issues.**
4. **Women empowerment**
5. **Violence against women: Statistics, manifestation, causes, government efforts, lacunae, way forward**

Concept of Gender: Socially constructed aspect of differences between men and women.

Manifestation of Gender:

- **Individual:** Men and women.
- **Cultural:** Aspirations, desires, values, attitudes, behaviour is shaped by gender
- **Structural: How gender stereotyping impacts the social position of women.** Sexual Division of Labour

How gender stereotyping impacts the social position of women:

- Stereotype: means a belief system that is irrational and generalised which overlooks individual differences)

<u>Gender stereotyping</u>	<u>Social position.</u>
Caring and nurturing: Women by nature are caring and nurturing.	It leads to Domestic division of labour (care wala kaam will be done by women: Child wala), low wages for care work, don't question women if laws are violated.

Soft skills: Women possess soft skill	There are certain jobs in labour market which are reserved for women. For eg: Reception, Nurse, Primary school teacher, secretary, etc. Pink Collared jobs
Emotional rather than rational: Women are perceived as more emotional rather than rational	Glass Ceiling (it refers to a transparent ceiling in every organization beyond which a woman is not promoted as women is not capable to take rational decision as they are more emotional. How many SC judges have been women. Low percentage of women in BOD). However, in time of crisis, woman is promoted to decision-making authority as the risk of failure is high (Glass Cliff). Glass Cliff is used as method to justify the failure on women.
Weak, passive and dependant	Violence against women is therefore high.

Patriarchy:

- It refers to the system of **social structures** and **practices** in which men oppress exploit and **discriminate** against women
- Although **patriarchy** refers to the domination by men, women equally place a significant role in perpetuating patriarchy. The concept is known as a **patriarchal bargain**.
- **Definition of patriarchal bargain:** A woman bargains with patriarchy to support male dominance to gain protection, status, resources and approval inside the system that she considers she might lose outside the system
- **Patriarchy** as a concept is **not** constant and gender relation has changed over time and space. The nature of control and subjugation of women varies with respect to class, caste, religion, ethnicity, etc. Hence, we can say Brahminical patriarchy is different from Dalit patriarchy and also that is different from tribal patriarchy.

Structure of patriarchy/ How does patriarchy operate? (Family, education, media, symbolism, caste, religion):

Family:

- The first lessons of patriarchy is learned at the family level.
- Boy child is considered as the inheritor whereas a girl child is considered as 'Paraya Dhan'.
- Since most of the families are patrilineal and patrilocal, it accords the low status to the girl child.

- Primary socialisation with respect to the notions of gender stereotyping.

Knowledge system:

- Patriarchal **construction of knowledge** perpetuates patriarchal ideology and this is reflected in our education system and media.
- **Objectification and commodification of women through media.** Eg: Advertisement. **Objectification of women** (women is not considered as human being but as an object of sexual desire and since she is considered as object of sexual desire, she is traded in market as commodity) **and commodification of women by media.** Eg: DEODARANT AD, ITEM NUMBER, SHOTS.
- **Education:** Content, the attitude of the teachers (teacher is a role model) and infrastructure (Functional toilets for girls). According to **ASER** (Annual status of education report) (by NGO **PRATHAM**) at the secondary level, the **dropout** of girl students is maximum due to a lack of functional toilets.

Symbolism:

- A more **subtle expression** of patriarchy is through symbolism by creating a **self-sacrificing image of women.** Through **ideological indoctrination**, the **notion of ideal womanhood** is created.
- Certain images are created for eg: damsels in distress image (abla naari) which is glorified through cinema

Religion:

- The patriarchal construction of social practices are legitimized by religion and religious institutions. **For Eg:** Certain personal laws are biased against women. Triple Talaq: personal law biased against women

Caste:

- Caste and gender are closely related and the sexuality of women is directly linked with the purity of caste. Hence, the caste system and caste endogamy retain the control over labour and sexuality of women. Hence, caste not only determines the social division of labour but also a sexual division of labour. The notion of purity and pollution has been extended to women.

Patriarchy vis-a-vis Work:

- Based on Gender stereotypes (Domestic division of labour): Women confined to private space ---> It was believed with the rise Female Labour Force Participation, notions of patriarchy will get challenged).
- However, instead of getting challenged, private patriarchy has been replaced by public patriarchy which has following manifestation:
 - Sexual Harassment at the workplace.

- Dual burden of work
- Glass ceiling
- Wage gap
- Pink collared jobs
- Violence against women.

Q) How does patriarchy impact position of middle class working class women in India? UPSC QUESTION.

Women in agriculture:

Statistics/concept:

- As per **Oxfam research**, agriculture employs **80%** of all economically active women in India. It consists of **48%** self-employed farmers and **33%** agricultural labour.
- According to the Agriculture Census, **14%** of land operational holdings are owned by women.
- **80%** of the farm work and **90%** of dairy production work is done by women.
- The wage disparity is as high as **35.8% between male and female worker**.
- According to Corteva Agri Science, **78%** of women in agriculture are subject to gender-based discrimination: harassment, more work, less pay

Feminization of agriculture:

- A measurable increase in women's participation in the agricultural sector is referred to as the feminization of agriculture.

Economic cause for Feminisation of agriculture:

- Since most farmers are small and marginal (to sustain the family income--> increased participation of women in agriculture).
- Male-specific migration to urban areas and hence feminization of agriculture.
- Employment of female means Cheap labour (wage gap is 35.8%).
- Small and marginal farmers cannot afford to hire labour on wages (depend on the labour of women in the family) --> which leads to the feminization of agriculture.
- Globalization has created opportunities but the opportunities are limited to skilled workforce, women in the rural areas have limited skill and low cultural capital so they work in agriculture sector

Socio-cultural cause for feminisation of agriculture:

- Socio-cultural acceptance of women working in the agriculture sector.
- Comparatively easy to manage Dual Burden.
- Flexible labour (patriarchal society, bargaining power of women (negotiation power) is less and women are made to work for very less wages) (Surinder S Jodhka)

- Feminization of Old-age due to migration of youth and Women tend to live longer
- Farmers suicide.

Politico-Administrative factors.

Government Initiatives:

- 15th October is celebrated as the women's farmers' day.
- 30% of budget is earmarked for women development.
- **Mahila Kisan Sashakti Pariyojana.**
- The government has also increased its focus on Self Help Groups to ensure sustainable livelihood for them.

Positives of the Feminization of Agriculture:

- It brings women to the public sphere.
- It provides an opportunity to socialize.
- It makes their labour visible and accounted for to some extent.
- It ensures the development of skills and confidence.
- It increases their bargaining power.
- It reduces the incidences of child labour and creates opportunities for the nutritional development of children.
- Case Study: Operation Flood + SEWA= employed 6000 women dairy co-operative led to the development of leadership, financial independency, child nourishment, etc.

Prepare 3-4 examples of association of women empowerment: Kudumshree of Kerala

Challenges:

- Dual burden of work
- Lack of ownership of assets (Eg: 14% of landholding owned by women).
- Lack of ownership of assets leads to non-availability of collateral security. It denies access to the formal credit system creating dependency on informal money lenders. This creates debt trap. This creates feminisation of poverty.
- Technological interventions are often not designed according to women farmers hence there is a lack of supportive infrastructure.
- **78%** of women farmers face Gender discrimination.
- Lack of autonomy with respect to decision-making on important issues such as marketing, crop selection, etc.
- Lack of awareness of their rights and their entitlements.
- Increased mechanization of agriculture has resulted in the concentration of women's menial jobs.
- Lack of gender-sensitive nature of agricultural extension services also creates challenges.

Women in industries and services:

Statistics

- According to **General Electric (G.E.)** and Avatar Research, In India women's participation in the manufacturing sector is 12%.
- According to the **Consulate General of Sweden**, In India women in the manufacturing sector are between 3% and 12%.
- According to **International Labor Organisation (ILO)**, In India women in the manufacturing and services sector combined is less than 20%.

Analysis of the statistics:

- Lack of awareness with respect to opportunities.
- Lack of women role models- according to **Deloitte**, only 4.7 % of CEOs in India are women.
- Lack of flexible working conditions, problems of accessibility and safety and security issues (Both at work place and public place).
- Restricted mobility after marriage.
- Socialization for domestic chores.
- Lack of Investment in technical and vocational education.
- Despite the increase in women enrolment in higher education, it is not getting reflected in the manufacturing and services sector. One of reason for career break can be due to reproductive responsibility and behaviour.

Viscous Cycle

- Patriarchy reduces the development and growth avenues of women that causes women to stay deprived or be dependent on male members.
- This deprivation/dependence restricts access to education and skill development which causes fewer opportunities for formal employment.
- The women hence remain confined to the informal sector.
- Informal employment sees women are getting paid less than minimum wages, less safe working conditions, no social security benefits, and severely restricted career progression.
- The social standing and bargaining power of such women remain stunted.

As per ILO, women in informal sector and part time jobs is more than that of men. The is feminisation of informal sector.

Female Labour Force Participation Rate:

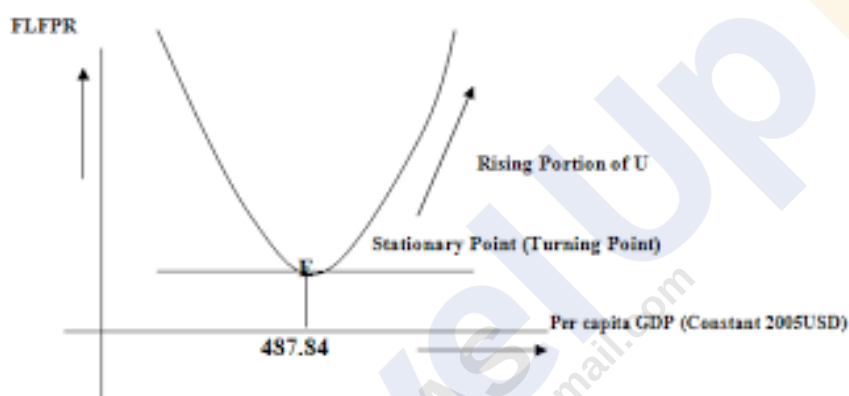

Statistics:

- As per the **Global Gender Gap** report by **World Economic Forum(WEF)**,
 - Female participation in the labour force is 22.3%.
 - WEF also says that the income earned by women is 1/5th of men. (**Wage Gap**)

- The percentage of women in technology in professional roles is 29.2% (**Women is semi skill and technical skill due to patriarchy**) (**Save money that could be given as dowry**)
- 14.6 % of women are at the senior level and only 8.9 % are at the managerial level. (**GLASS CEILING**)

Causes for decline in FLFP: As per IMF Paper and Economic Survey,

- **Increase in household income.**
- **Caste notions of purity and pollution extend to gender roles** (Uma Chakravarti's **concept of Brahmanical Patriarchy**)
- **Feminization U hypothesis:** Feminization U hypothesis suggests that initially, female labor force participation will reduce with increasing economic growth, but will ultimately increase as the economy grows and undergoes substantial structural changes. [This has been given in Economic Survey 2018-19](#)

- **Lack of investment in sectors** that can readily absorb women like textiles, apparel, FPI, agriculture etc.
- **Lack of incentive among women to work** (to avoid probs like dual burden of work, glass ceiling, wage gap, pink collared jobs, lack of autonomy to take decisions, glass cliff, lack of the financial autonomy on the money earned).
- **Infrastructural constraints** lack of CCTVs, conducive environment (functional toilets), crèche facilities etc at workplaces.
- **Social constraints** like socialization for domestic chores, rigid patriarchal setup, career breaks, gender stereotype etc.
- **Digital divide-** A study says that only 21% of women in India are internet users. So women have minimal participation in the gig and platform-based jobs.
- Lack of autonomy in working like Sarpanch Pati, etc.
- According to **Azim Premji University State of Working India report-** 7% of men have lost jobs post covid, whereas 47% of women have suffered permanent job loss after covid.
- According to **Mckenzie Global Institute**, 12 million Indian women will lose jobs by 2030 due to automation. Automation as a threat is more for pink collared jobs.

- Since the passage of the **Maternity Benefit Act (Amendment), 2017** the desirability of women in the reproductive age group has declined in the formal labor market. This leads to removal of females in private organisation.

Effects of low FLFP

On Women:

- Lack of opportunity for upward social mobility.
- Lack of financial autonomy.
- Lack of decision-making authority.
- Lack of ability to influence the direction of social change.
- Lack of identifying and embracing their own feelings that may cause **Self - Alienation**.
- It can negatively impact the cognitive development of women.

On Family:

- The lost income might decrease the standard of living of the family.
- Low status of women within the household
- Perpetuation of patriarchy. (Patriarchal bargain)
- It also affects inter personal relationship

On the Nation:

- It might cause a substantial part of the demographic dividend to turn into a demographic burden. It also poses a challenge to reap the benefits of demographic dividend.
- It comes with a large impact on economic growth- According to **Mc Kinsey**, if FLFP gets equal to MLFP, then Indian GDP will increase by 60 %.
- It will increase the incidences of social evils such as domestic violence, child marriage, dowry, etc.
- Challenges in achieving SDG5

On an International Level:

- It will threaten the prospects of India emerging as a global power, as poor indicators of FLFP will severely dent our soft power.
