

Continental Drift Theory

Continental Drift Theory: Background

Debate: Academic Debate

- What is the mystery of the fold mountains?

Fold mountains: Composed of marine sediments and have long linear chain of mountain. Fold Mountains are unique to the earth and understanding fold mountain is like understanding the evolution of the crust.

Earlier Interpretation:
Mountains are the wrinkles on the earth's surface associated with the cooling.

This theory believes permeants of the crust.

Crust theory:

Drawback:

Flawed driving mechanism gravity need to be 10000xx more to drive SIAL.

No explanation non continent islands. ex. Volcanic island Hawaii Mauritius ,
Coral island Lakshadweep.

All the island are not continental island.

Criticisms:

Contribution:

The evolution of the earth's crust

- 1) As nebula cooled and contracted to form the planet there was lot of volcanisms that was being experience
- 2) the rock of mental peridotite experienced partial melting to form basalt and the first crust which was basaltic in nature are formed. (the present

days oceanic crust is basaltic. therefore, oceanic crust is said to be fundamental crust.

- 3) The earths experience lots of meteoric impact which broke the first crust that was been formed therefore basaltic crust subducted into the mantle undergo partial melting to form andesitic rocks. (andesite has lower density basalt therefore andesite does not subduct into mantle.)
- 4)
